

JavaScript Object Practice Questions (40)

1. Create an object and access its properties.
2. Add a new property to an object.
3. Delete a property from an object.
4. Check if a property exists in an object.
5. Find the number of properties in an object.
6. Loop through all properties of an object.
7. Convert an object into an array of keys.
8. Convert an object into an array of values.
9. Convert an object into key-value pairs.
10. Clone an object.
11. Merge two objects.
12. Find the sum of all numeric values in an object.
13. Find the largest value in an object.
14. Find the smallest value in an object.
15. Sort object properties by value.
16. Sort object properties by key.
17. Count frequency of elements using an object.
18. Find duplicate values in an object.
19. Remove a property from a nested object.
20. Access deeply nested properties safely.
21. Deep clone an object.
22. Compare two objects for equality.
23. Freeze an object and test modifications.
24. Seal an object and test modifications.
25. Use destructuring with objects.
26. Rename properties using destructuring.
27. Convert array to object.
28. Convert object to JSON string.
29. Convert JSON string to object.
30. Find all keys with a specific value.
31. Group array items using an object.
32. Flatten a nested object.
33. Implement your own `Object.keys()`.
34. Implement your own `Object.values()`.
35. Implement your own `Object.entries()`.

36. Find the difference between two objects.
37. Find common properties between two objects.
38. Merge nested objects recursively.
39. Create a custom deep equality checker.
40. Build a student management system using objects.
